Algyhy

🗨️ | ✎️ SIGN IN TO EDIT | ⋮

This fan-fiction article, **Algyhy**, was written by [Witcher190](#). Please do not edit this fiction without the writer's permission.

Algyhy is a witcher elixir designed to stimulate the witcher's body into rapidly producing more blood. Its primary function is to aid in recovery after intense battles where the witcher has suffered severe blood loss. While witchers are known for their heightened resilience and regenerative abilities, there are situations in which the body cannot recover blood quickly enough, leaving the witcher vulnerable and weakened. Algyhy steps in during such critical moments to expedite the production of blood, allowing the witcher to regain their strength and continue fighting or recover without needing prolonged rest.

However, for the elixir to function properly, the witcher must ensure that all sources of bleeding have been thoroughly sealed before ingestion. If there is even a small wound that continues to bleed, Algyhy will not only fail to work but will also

is not fully stabilized.

Because of the inherent risks and the difficulty in obtaining the rare and often dangerous ingredients required for its creation, Algyhy is used sparingly. Witchers tend to reserve it for situations of dire need, where their survival hinges on their ability to recover blood quickly after bleeding has stopped. The process of ensuring the body is stable before ingestion is critical, as the witcher's pain is often dulled by elixirs, making it difficult to assess whether a wound is still open. As such, many witchers avoid using Algyhy unless they have no other choice.

have survived the experience as akin to suffering from both severe flu and hypothermia simultaneously. The witcher will often feel clammy, with cold sweats, congestion, and a frequent need to urinate. Some witchers have reported coughing up excess phlegm or feeling an intense nausea due to bile buildup. These symptoms can make recovery uncomfortable, despite the life-saving benefits of the elixir.

Toxicity	Medium
Duration	From 2 to 5 hours, though the side effects can last a little longer

Description ⚡

Once fully brewed, Algyhy should possess a dark pink hue, with a distinct lean towards fuchsia in many cases. Its texture is slightly viscous, and it emits a faintly metallic scent, hinting at the blood component present within the concoction.

Ingredients ⚡

The rare and dangerous ingredients include:

- **Alp blood:** Extracted from this type of vampire, this blood is known for its regenerative properties, as well for its ability to enhance the production of red blood cells when properly prepared. As such, when Alps fight an enemy and won, they usually need to consume more blood to replenish the loss of blood they used to regenerate their wounds in combat.
- **Striga's heart:** The heart of a striga, is a potent magical component that accelerates healing but is notoriously difficult to acquire due to the rarity of the curse.
- **Eyehead venom:** A rare toxin of the almost extinct monster that, when properly diluted, stimulates the body's adrenal response, pushing it into overdrive and assisting with accelerated recovery processes.
- **Aglaophotis:** An herb that helps regulate the elixir's effects, preventing an overdose of the more dangerous components such as the eyehead venom.
- **Wyvern Blood Spirit (base):** This highly potent alcohol serves as the foundation of the elixir, binding the other ingredients and helping to catalyze their effects within the witcher's body.

Preparation ⚡

The preparation of Algyhy is an intricate process that requires both precision and caution. Each step is crucial to ensuring the elixir's effectiveness and safety. Here's a detailed breakdown of the preparation process:

Striga Heart Preparation ⚡

- **Extraction:** Begin by acquiring a striga heart. After that the heart should be carefully cleaned to remove any residual flesh and impurities.
- **Drying:** The heart is then dried using a controlled process to prevent any loss of magical properties. This can involve air drying or using a specialized drying chamber.

- **Distillation:** Once dried, the heart is ground into a fine powder. This powder is mixed with a solvent, often a neutral base like distilled water, and distilled to extract its essence.
- **Purification:** The extracted essence is purified to remove any lingering impurities or residual toxins. This step is critical to ensure that the final elixir does not contain harmful components.

Wyvern Blood Spirit Integration ✦

- **Preparation:** Obtain wyvern blood spirit. Recommended to be obtained directly from a druid, as other could be fake or of less quality. This spirit should be preferably aged, to ensure its efficacy in the elixir.
- **Mixing:** Combine the purified striga heart essence with the wyvern blood spirit in a large, heat-resistant vessel. Stir gently to blend the two components thoroughly. The mixture should take on a faintly pinkish hue as the essence integrates with the spirit.

Incorporation of Alp Blood ✦

- **Collection:** Alp blood is a delicate component requiring careful handling. It should be collected from a freshly slain alp, ideally within a few hours of its death to preserve its regenerative properties.
- **Preparation:** The blood is filtered to remove any particulate matter and then combined with the striga-wyvern mixture. This integration is done gradually to prevent any reaction between the components.
- **Blending:** The mixture is stirred until the alp blood is evenly distributed throughout. The solution will take on a deeper pink or fuchsia hue at this stage, indicating the presence of the blood.

Eyehead Venom Dilution ✦

- **Extraction:** Eyehead venom is extracted from the venom sacs of the nearly extinct Eyehead monster. This process is performed under strict safety measures due to the venom's potency.
- **Neutralization:** The venom is diluted with a neutralizing agent, often a base like saline solution, and then boiled. This boiling process is crucial for reducing the venom's toxicity while preserving its stimulating properties.
- **Incorporation:** Once neutralized, the venom is added to the elixir mixture. Careful stirring ensures that the venom integrates smoothly without causing any unwanted reactions.

Aglaophotis Infusion ✦

- **Preparation:** The Aglaophotis is prepared by grinding it into a fine powder. The powder is then mixed with a small amount of distilled water to create an infusion.
- **Infusion:** The infusion is added to the elixir mixture in small amounts. The aglaophotis helps to regulate the effects of the other ingredients and prevent an overdose.
- **Removal:** After the infusion process is complete, the herb is strained out to ensure that only its beneficial properties remain in the elixir.

Final Adjustment ✦

- **Cooling:** The mixture is allowed to cool to room temperature. During this cooling period, the elixir should be stirred occasionally to maintain consistency.
- **Testing:** A small sample of the elixir is tested to ensure its potency and safety. This can involve checking its pH level and its effect on a test subject under controlled conditions.
- **Storage:** The final elixir is transferred into airtight, dark glass vials to protect it from light and air, which could degrade its quality. The vials are labeled and stored in a cool, dark place until needed.

Side Effects

Algyhy's side effects stem from the elixir's profound impact on the body's hematopoietic processes and its subsequent cascading effects on other fluid-producing systems. The rapid induction of blood production by Algyhy triggers a series of physiological responses that can overwhelm the body's natural balance. Here's a explanation of these side effects:

Cascading Fluid Production

Algyhy accelerates the production of red blood cells (erythropoiesis) through enhanced hematopoietic processes. This increased production raises the demand for various nutrients and fluids necessary for blood cell creation, such as plasma, which constitutes a significant portion of blood. The body's blood volume and fluid balance are intricately regulated. When blood cell production spikes rapidly, the body's fluid regulation mechanisms must adjust to meet this heightened demand. This abrupt shift can disrupt normal fluid balance, leading to overproduction of other bodily fluids as the body attempts to compensate.

Excessive Mucus Production

Potent ingredients like eyehead venom and alp blood can trigger an inflammatory response. The immune system may increase mucus production as a defensive mechanism to trap and eliminate perceived toxins or foreign substances. Rapid changes in blood chemistry and the introduction of these potent ingredients can stimulate mucosal membranes throughout the respiratory and digestive systems, resulting in heightened mucus secretion.

Increased Sweat Production

The elixir's accelerated metabolism and heightened physical stress activate the body's thermoregulatory systems. Excessive sweating is a common response as the body tries to maintain a stable internal temperature despite the increased metabolic rate. Sweating also aids in expelling excess toxins and metabolic byproducts from the rapid blood production and breakdown of the elixir's components.

Excessive Urination

Increased blood production leads to higher plasma levels, which the kidneys filter and excrete as urine. This added load on the kidneys results in more frequent urination. Some components of Algyhy, such as wyvern blood spirit, may have mild diuretic effects, further contributing to increased urine production as the body processes and eliminates the elixir's ingredients.

Increased Bile Production

Enhanced metabolic activity and potent ingredients in the elixir stimulate the liver and gallbladder to produce more bile. Bile is crucial for digestion and fat breakdown, and its increased production responds to the elevated metabolic demands. Bile production also helps detoxify the body by facilitating the excretion of waste products. The rapid breakdown of the elixir's components can lead to increased bile production.

Elevated Semen Production

The stimulation of hematopoietic processes and the introduction of potent magical components can alter hormonal balances, potentially increasing testosterone and other reproductive hormones, which leads to elevated semen production. The overall increase in metabolic activity induced by the elixir can impact the reproductive system, contributing to higher semen production.

Description of the Symptoms of the Side Effects

The sudden overproduction of fluids creates a sensation described by those who have experienced it as akin to suffering from both severe flu and hypothermia simultaneously. The witcher may feel clammy, with cold sweats, congestion, and a frequent need to urinate. Some report coughing up excess phlegm or experiencing intense nausea due to bile buildup. These symptoms, while uncomfortable, are a direct consequence of the body's struggle to maintain homeostasis under the influence of Algyhy.

It is worth noting that not all fluids are expelled immediately. Some remain in the body, causing delayed side effects that can persist for several hours or even days after the elixir has taken effect. Despite the discomfort, many witchers consider Algyhy's benefits to outweigh its side effects, especially when the alternative is death from blood loss.

Trivia

- The name derives from Ailgyflenwi Gwaed in Welsh meaning "Blood Replenishment"
